AROMA CHEMICALS INDUSTRY OVERVIEW

- The global aroma chemicals market size was valued at USD 6.55 billion in 2025 and is expected to expand at 7.7% CAGR to reach USD 8.82 billion in 2029.
- The demand for the product is anticipated to be driven by increased consumption of flavours and fragrance products in the cosmetics & toiletries, soaps & detergents, and food & beverages industries.
- The terpenes & terpenoids segment is expanding at a CAGR of 8.20% from 2025 to 2033.
- Technological innovation in the market for extraction of aroma chemicals, and a surge in R&D activities among key industry participants have contributed to the growing varieties of customized aroma chemicals for targeted applications. Changing lifestyles and increasing consumer awareness has contributed to overall growth.
- The high share of the segment is attributable to surging demand for beverages & processed foods, growing disposable income, the rising popularity of natural aroma chemicals, as well as increasing demand for cosmetics and toiletries.

Growth Drivers:

- Increasing demand for health and wellness foods, government regulations, ban on the use of synthetic flavours are fueling the growth of natural aroma chemicals.
- The suitability of natural flavours in wider applications, additional health benefits of certain natural flavours, and advanced technological innovations are the key factors driving the market for aroma chemicals.

Applications:

- Can be found in food, wine, spices, essential oils, perfumes and fragrance oils. These compounds have a considerable role in the manufacturing of flavours and fragrance.

A Fragrance compound, also known as an odorant, aroma, is a chemical compound that has a smell or Oduor.

Perfume is described as having three sets of notes, making the harmonious scent accord. The notes unfold over time, with the immediate impression of the top note leading to the deeper middle notes, and the base notes gradually appearing as the final stage.

OAL delivers innovative fragrance formulations to a wide set of customers. The Company continually strives to find the best balance between creativity and functional needs to develop fragrances with the highest acceptance and the best release performance in the final product.

Flavour is the sensory impression of food or other substance and is determined primarily by the chemical senses of taste and smell.

Smell is the main determinant of a food item's flavour.

While only five basic tastes - sweet, sour, bitter, salty and umami (savory) are universally recognized, the number of food smells is unbounded.

A "flavourant" is defined as a substance that gives another substance flavour, altering the characteristics of the solute, causing it to become sweet, sour, tangy, etc.

These mixtures are formulated by OAL to give a food product a unique flavour and to maintain flavour consistency between different product batches or after recipe changes.

APPLICATIONS

FACTS OF FRAGRANCES AND FLAVOURS

The sense of smell is the first of all our senses to develop. Even before we are born, our sense of smell is fully formed and functioning.

Studies show that 75% of emotions are triggered by smell which is linked to pleasure, well-being, emotion and memory – handy when you want people to buy your products.

A study indicates that 80% of the flavours we taste come from what we smell (which is why foods can become flavourless when we have a blocked nose)

Scents can have positive effects on mood, stress reduction, sleep enhancement, self-confidence and physical and cognitive performance.

Smell is the most sensitive of the senses. People can remember smells with 65% accuracy after a year, while visual recall is about 50% after three months.

The human brain can process roughly 10,000 smells in an area the size of a postage stamp, each triggering a neural response.

Your sense of smell accounts for 75-95% of the impact a flavour has.
